

Historical Energy Consumption in the United States (1850–2015)

Energy Consumption in the United States (1776-2015)

World Energy Outlook

Renewables are projected to be the fastest growing fuel, up 6.6% p.a. by 2035.

31% of primary global energy consumption comes from oil, making it the most widely used energy source.

Oil will decline by 5 percentage points in the 2035 energy mix compared to 2011.

Natural gas will reach a 24% share by 2035, with total energy demand estimated at 17.386 billion tons of oil equivalent.

Energy consumption is expected to increase by 34% by 2035.

Coal demand in both the U.S. and OECD Europe is projected to fall by more than 50% by 2035.

A Quadrillion BTU = 45 million tons of coal

1 trillion cubic ft. of natural gas

170 million barrels of crude oil

Total Energy Used in the U.S. each year = 95 Quadrillion Btu
